L3/rACTI intron/EGFP:NPTII/TT7, that is used in the generation of PEP:NPTII fusion protein constructs. It contains an expression cassette comprising, a promoter from the maize L3 oleosin gene, the rice actin 1 intron, the coding sequence of EGFP:NPTII translational fusion, excised from DV126 and the Tr7 terminator. This plasmid is used to carry a chimeric gene, comprising an aleurone-specific promoter like L3, that is operably linked to a gene encoding a screenable marker, like Green allow both selection and screening of transformants. The aleurone-specific promoters direct the expression of the marker genes in embryogenic tissues, allowing selection and screening of viable

ö
chimeric gene, comprising an aleurone-specific promoter like L3, that is operably linked to a gene encoding a screenable marker, like Green fluorescent protein (GPP), luciferase or maize R gene. The gene fusions allow both selection and screening of transformants. The aleurone-specific promoters direct the expression of the marker genes in embryogenic tissues, allowing selection and screening of viable transgenic seeds. Screening of transgenic seeds avoids the need for growing and assaying of seeds for transgenes and allows implementation of automated seed screening techniques for the identification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Transgenic plant; winter oilseed rape; hybrid seed; male-sterility gene; fertility restorer gene; barstar gene; ss.

```

The specification describes a pair of transgenic winter oilseed rape plants suited for producing hybrid seed. One of the plants has an expression cassette comprising a male-sterility gene, and the other plant has an expression cassette comprising a fertility restorer gene, integrated into the genome. The fertility restorer gene is capable of preventing the activity of the male-sterility gene. The plant pair is useful for producing hybrid seed. Plants developed from the hybrid seed have agronomic performance, genetic stability and adaptability to plasmid prHWII8. This plasmid comprises the barstar gene, which acts as a fertility restorer gene. The plasmid is used to create transgenic plants of the invention.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.

APPLICANT: SOSTAERT, Piet
APPLICANT: STAM, Malke
APPLICANT: STAM, Malke
APPLICANT: STAM, Malke
APPLICANT: TALE OF LINVENTION: UNDIFIED BACILLUS THURINGIENSIS
TITLE OF INVENTION: INSECTICIDAL - CRYSTAL PROTEIN GENES AND THEIR EXPRESSION
TITLE OF INVENTION: IN PLANT CELLS
NUMBER OF SEQUENCES: 23
CORRESPONDENCE ADDRESS:
ADDRESSE: Burns, Doane, Swecker & Mathis
STREET: George Mason Bldg., Washington & Prince Sts.
CITY: Alexandria
STATE: Virginia
COUNTRY: United States
COMMITMED ADDRESS: 222131-4404
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            GENERAL INFORMATION:

/lab_host="E. Coli strain XL10-Gold, T1-resistant, F-"
/note="Vector: PWD42nv; Purified genomic DNA from M.
musculus G75BL/67 (male) was obtained from the Jackson
Laboratory Mouse DNA Resource
(http://www.jax.org/resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polymucleotide kinase. Adaptor oligonucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pWD42 (gil47321H gib]AR129072.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. coli Xi10-Gold (Stratagene) cells
and selected for ampicillin resistance."

//nab_host="E. Coli strain XL10-Gold, T1-resistant, F-"
//note="Vector: PWD42nv; Purified genomic DNA from M.
musculus G57BL/6J (male) was obtained from the Jackson
Laboratory Mouse DNA Resource
(http://www.jax.org/resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end repaired with T4 DNA polymerase and T4
polynucleotide kinase. Adaptor oligonucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gal
electrophoresis. Vector DNA was prepared from a derivative
5'-ATTCTAGAGGCGGGCGGCGGATG-dT(30)BN-3' (where B = A, C, or G and N = A, C, G, or T). Average insert size 1.65 kb (range 0.5-4.0 kb). 15/15 colonies contained inserts by PCR. This library was enriched for full-length clones and was constructed by Clontech Laboratories (Palo Alto, CA). Note: this is a NIH_MGC Library."

of pWD42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli Xii0-Gold (Stratagene) cells and selected for ampicillin resistance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Contact: Zhang Xu.

                                                                                                                                                                                                seed, cells or tissues, characterised by harbouring a specific transformation event, particularly by the presence of a male-sterility gene, at a specific location in the Brassica genome. Transgenic Brassica plant is useful for producing a hybrid seed by crossing the transgenic plant with a male-fertile Brassica plant and harvesting the hybrid seed from the transgenic Brassica plant.

The present invention relates to a transgenic Brassica plant or its seed, cells or tissues, characterised by harbouring a specific transformation event, particularly by the presence of a male-sterility gene, at a specific location in the Brassica genome. Transgenic Brassica plant is useful for producing a hybrid seed by crossing the transgenic plant with a male-fertile Brassica plant and harvesting the hybrid seed from the transgenic Brassica plant.

The present sequence is left (3') border flanking region of elite event
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  by

Barnase expression disturbed the function of stamen cells leading to male sterility. Constitutive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              5692 TAAATITATIGGAAGCAAGITIAAAATICAGAAATATITCAATAACIGATIATATATATCAGCIGG

The present invention relates to a transgenic Brassica plant or its seed, cells or tissues, characterised by harbouring a specific seed, cells or tissues, characterised by harbouring a specific transformation event, particularly by the presence of a male-sterility gene, at a specific location in the Brassica genome. Transgenic transgenic Diant with a male-fertile Brassica plant and harvesting the hybrid seed from the transgenic Brassica plant and harvesting the hybrid seed from the transgenic Brassica plant. The present sequence is chimeric T-DNA of plasmid procoll3. This sequence comprises right border repeat, left border repeat and 3' untranslated region (UTR) from TL-DNA of prib653, synthetic polylinker sequences, coding regions of blalahos resistance gene (bar) from Streptomyces hygroscopicus, barnase gene from Bacillus amyloliquefaciens and barstar gene from anther-specific gene TA29 from Arabidopsis thaliana, the anther-specific gene TA29 from the T-DNA of pri137
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           δy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Transgenic Brassica plants, seeds, cells or tissues, characterized harboring specific transformation events, particularly by presence male-sterility gene, at specific location in its genome -

                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents a plasmid PGKB5. The plasmid contains a plant promoter that directs expression of a selected sequence in root cells at all stages of development of a plant. The plant promoter is used to control expression of genes in a root-specific manner, especially genes that provide resistance to parasites, pests (nematodes or fungl), water and salt stress, or alter sugar content or nitrogen transport. Fragments of the promoter are useful as probes or primers to detect or amplify at least part of the promoter.

The present invention relates to a method for producing male sterile plants. The method comprises inserting a promoter fragment upstream of an RNAse gene and a second promoter, upstream of an RNAse inhibitor protein gene and inserting it into the plant genome. The method is useful for producing male sterile tobacco, lettuce and rapeseed plants, but preferably rice and maize. The present sequence is a vector used in the method of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             5043

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        284 atagtitaaatatitatigataaaataacaagicaggiattatagiccaagcaaaacai 343
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Plasmid pTS174; male sterile; barnase; ribonuclease; transgenic plant;
                                                                                                                                                                                                                                                      The invention relates to the generation of male sterile plants by the introduction of a mutant barnase gene (AA291095) for expression specifically in the anther of a plant. This sequence represents the E. coli/Agrobacterium shuttle vector plasmid pTS172 which contains the mutated barnase gene (AA291095) under control of the cauliflower mosal virus 35s promoter. The vector also contains a region of the Agrobacterium T-DNA gene 7. The vector is used for transmitting the barnase gene to plants via an Agrobacterium tumefaciens host cell. The transformed plant is used in plant breeding.
                                                                                                                                                                                                                                                                                                                                                                                                                  224 atgtacatggccgataagaaaaggcaatttgtagatgttaattcccatcttgaaagaat 283

Plasmid pTS174 (AAT39336) contains Bacillus barnase DNA under control of the stamen-specific PEI promoter. Embryogenic callus from rice cv. Kochihibitiki was transformed with pTS174 alone or with pTS88 (see also AAT3937), a plasmid contq. barstar DNA under control of a 35S promoter. With pTS174 alone, I male sterile line was recovered from 48 electroporation cuvettes. With both plasmids, 7 normal male sterile lines were recovered from 40 cuvettes. Barnase expression disturbed the function of stamen cells leading to male sterility. Constitutive expression of barstar counteracted any low level expression of barnase in non-stamen tissue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /*tag= e

Plasmid pTS172 and plasmid pTS772 (see also AAT61395) were used to transform wheat spring variety Pavon calli via particle bombardment. Some calli were treated with the poly-(ADP-ribose) polymerase inhibitor nlacinamide before, or before and after, bombardment. Healthy, male sterile plants were regenerated only from bombarded calli that were treated with niacinamide. This was believed to be due to more faithful expression characteristics of the integrated stamen-selective batnase gene in these calli and regenerated shoots. For plants transformed with pTS172, foreign DNA was stably incorporated in the wheat genome in 2-3

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                The invention relates to the generation of male sterile plants by the introduction of a mutant barnase gene (AAZ91095) for expression specifically in the anther of a plant. This sequence represents the E. coll/Agrobacterium shuttle vector plasmid pTS172 which contains mosaic virus 35s promoter. The vector plasmid pTS172 which contains mosaic virus 35s promoter. The vector also contains a region of the Agrobacterium T-DNA gene 7. The vector is used for transmitting the barnase gene to plants via an Agrobacterium tumefaciens host cell. The transformed plant is used in plant breeding.
                                                                                                                                                                                                                              Mutate barnase gene for efficient construction of plant transformants, particularly male sterile plants free from any undestrable characters by specifically expressing the gene alone in anther
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    6363

                                                                                                                              The present invention relates to a method for producing male sterile plants. The method comprises inserting a promoter fragment upstream of an RNAse gene and a second promoter, upstream of an RNAse inhibitor protein gene and inserting it into the plant genome. The method is useful for producing male sterile tobacco, lettuce and rapeseed plants, but preferably rice and maize. The present sequence is a vector used in the method of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                   region containing polyadenylation signal of gene 7 og Agrobacterium T-DNA
                                                                                                                                                                                                                                                         The HindIII-ECORI fragment (AAT39337) of plasmid pTS88 contains barstar DNA under control of a 355 promoter. The plasmid was used with pTS174 (see also AAT39336) contg. barnase DNA under control of the stamen-specific promoter El to produce male sterile rice cv. Kochihibiki transgenic plants, and with plasmid pVEI36 (see also AAT39338) contg. barnase DNA under control of the stamen-specific PCA55 promoter to produce male sterile maize plants. Expression of barnase (a ribonuclease) in the stamen leads to male sterility. Constitutive expression of barstar counteracts possible
                                                                                                                                                                                              Prodn. of male sterile plants by transforming with a chimaeric construct - comperising a male sterility DNA e.g. barnase and a co-regulating gene, e.g. barstar, into the nuclear genome, useful for generating hybrid cultivars
                                                                                                                                                                                                                                                                                                                                                                                      DB 17; Length 1303;
                                                                                                                                                                                                                                                                                                                                                                                                         .

                                                                                                                                           The specification describes a pair of transgenic winter oilseed rape plants suited for producing hybrid seed. One of the plants has an expression cassette comprising a male-sterility gene, and the other plant has an expression cassette comprising a fertility restorer gene, integrated into the genome. The fertility restorer gene is capable of preventing the activity of the male-sterility gene. The plant pair is seed have agronomic performance, genetic stability and adaptability to different genetic backgrounds. The present sequence represents plasmid primylls. This plasmid comprises the barstar gene, which acts as plants of the invention.
Transgenic winter oilseed rape plants suited for producing hybrid seed with improved qualities, comprises a male sterility gene and fertility restorer gene, integrated into the genome

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                plasmid pTHW107 is a vector carrying T-DNA (AAT59531) comprising a barnase coding sequence under control of the tobacco TA29 gene stamen specific promoter and a phosphinothricin acetyltransferase coding sequence under control of an Atabidopsis Rubisco small subunit gene promoter. Oilseed rape hypocotyl explants were subunit gene promoter. Oilseed rape hypocotyl explants were infected with Agrobacterium tumefaciens CSBCIRif carrying vector PTW107 and helper Ti plasmid pMP60. In some treatments, the hypocotyls were treated with the poly-(ADF-ribose) polymerase inhibitor niacinamide (250 mg/l) 4 days prior to infection. Plants regenerated from miacinamide-treated transformed calli had a low copy number and displayed less variation in the expression profile of the transgenes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Prodn. of transgenic plants using a poly-(ADP-ribose) polymerase inhibitor - reduces the cultured cells response to stress and reduces metabolism
